Production Line Update for Explosives Detection (EDD) K-9 Units

X-Test™ is releasing a breakthrough in Explosives Detection technology Via the use of explosive odor scent material for federal, state and local K-9 divisions.

Benefits include:

- **More realistic training**

Certification standards vary from the local to federal level. All canine handlers are aware of the constant need for realistic training with varying types and concentration of explosive odor. Whether State, Local or Lackland evaluation criteria. X-Test products provide a broader range of training in order to achieve success imposed by training missions and evaluations.

- **Safer storage and transport**

Storage and transport are often an issue when training the EDD on explosives odor. Explosives regulations are an encumbrance to accurate and realistic training. Canine odor explosive products benefit the requirements and safety precautions incumbent when utilizing live explosives.

- **Increased amount of simulant odor for differential threshold detection**

High placement, low placement, quantity and odor proliferations are always part of the training regiment when properly training a canine. The use of X-Test™ explosive material provides the various thresholds encountered during evaluations and real world scenarios.

- **Lessor hazard of cross contamination**

The possibility of cross contamination is ever present when working with explosives and odor compounds. X-Test™ is dedicated to ensuring the canine is working each scent according to its chemical composition to reduce the possibility of odor cross contamination.

We at X-Test™ are prepared to meet with you and provide in-depth and comprehensive information as well as practical demonstrations with your canine units. Terrorist activities are increasing daily.

X-Test™ abilities and resources must be able to adapt and evolve to the threat. We at X-Test™ are working for your Safety.
