New Line of Explosives Simulants for Tactical Training

Tamar Explosives has launched a new line of affordable inert explosives simulants to support the tactical training of bomb squads, SWAT teams and EOD units. The new line was developed by Tamar's experts, based on their broad theoretical knowledge and extensive hands-on experience, with the aim of supplying these users with true-to-life training aids that serve their particular purposes.

As tactical teams do not utilize advanced technological explosives detection systems, the simulants developed for them do not need to possess qualities such as density, Zeff, etc., and are therefore less costly to manufacture, yet equally effective for their intended use.

The new simulants developed by Tamar accurately duplicate the color and texture of a wide variety of explosive materials, as well as their original packaging. They can be contaminated with explosives to allow detection by sniffers. Being inert, they support effective instruction and exercises without posing any risk whatsoever.

The new line includes the following simulants and accessories:

**Semtex H | Semtex A | Semtex 10 | C4 | TNT block | Detasheet
Shock tube | Dynamite | Aluminum and copper detonators**
